Self-Review Reflection

This assignment took me longer than I expected because I ran into a few issues while working with SQL. Some statements did not work the way I expected, so I had to go back, check my queries, and figure out what was causing the errors. The parts involving related tables were especially challenging because I had to pay attention to the order in which records were inserted, updated, and deleted.

I worked with Sanyam on this assignment, and he helped me a lot when I got stuck. His help made it easier to understand the errors I was getting and work through the problems instead of just moving on without knowing what went wrong. Working with him also helped me understand some of the SQL concepts more clearly.

By completing the exercises, I got more practice with creating full and partial backups, inserting records, updating data, and deleting records. I also learned how important it is to understand foreign key relationships and to verify the results after running a statement.

Overall, this assignment was challenging, but it was a useful learning experience. I was able to work through the issues with Sanyam's help and get a better understanding of how these SQL operations work. For the next assignment, I want to start earlier and improve my troubleshooting skills so I can solve more problems independently.
